

Small Mammals

Small animals should not be skinned unless by a professional. Don't gut the animal. Small mammals, especially carnivores, will spoil quickly because of their thin hide and bacteria. If you can't take the small game animal immediately to a taxidermist, as soon as the carcass cools completely, put it in a plastic bag and freeze it. ***With the epidemic of rabies evident in many areas of the country take every safety measure necessary when handling your game.***

Birds

Do not gut the bird. Rinse off any blood on the feathers with water. Take the bird immediately to your taxidermist or freeze it. Put the bird into a plastic bag for freezing being careful not to damage the feathers, including the tail. If the birds tail feathers do not fit in the bag do not bend them. Let the tail stick out of the bag and tie the bag loosely.

Fish

Do not gut your fish. If you can not take your fish immediately to a taxidermist, wrap it in a very wet towel and put it in a plastic bag, making sure all the fins are flat against the fish's body (to prevent breakage), and freeze it. A fish frozen with this method can safely be kept in the freezer for months. ***Note: A fish will lose its colouration shortly after being caught. A good colour photograph immediately after the catch may enable the taxidermist to duplicate the natural colour tones of that particular fish.***

Tips

Always have appropriate tags with your trophies when you take them to your taxidermist. Do not cut the ears for attachment.

For situations where you are hunting with no available taxidermist or freezer, ask your taxidermist about techniques to skin out the entire cape (including the head) and salting the hide. This is the only method in remote locations that can preserve our hide for later mounting.

Note: Because of the various diseases that wild game can transmit to humans, always use extreme caution when handling the carcass. Use rubber or latex gloves and thoroughly wash your hands with soap and water after handling.

SKINNING GUIDE

Field Dressing

1. With the antelope on its back make a shallow cut through the skin just below the breastbone. Make sure that you start your cut well away from the brisket allowing plenty of uncut skin for your shoulder mount. Insert two fingers of the free hand, cradling the blade, to hold the skin up and away from the entrails (Figure A).
2. Cut straight down the belly and around the genitals, separating but not severing them from the abdominal wall. Slit the belly skin all the way to pelvic bone (Figure B).
3. Cut deeply around the rectum, being careful not to cut off or puncture the intestine. Pull to make sure the rectum is separated from tissue connecting it to the pelvic canal. Pull the rectum out and tie string tightly around it to prevent droppings from touching the meat. Lift the animal's back quarter a bit, reach into the front of the pelvic canal, and pull the intestine and connected rectum into the stomach area.
4. If you want to make a full shoulder mount, do not cut open the chest cavity. Cut the diaphragm away from the ribs all the way to the backbone area. Reach into the forward chest cavity, find the esophagus and windpipe, cut them off as far up as possible (Figure C), and pull them down through the chest.
5. Roll the antelope onto its side, grab the esophagus with one hand and the rectum/intestine with the other. Pull hard. The antelope's internal organs will come out in one big package with a minimum of mess.

Caping, the process of skinning out a trophy animal, is best left to the taxidermist. Their experience skinning, especially the delicate nose, mouth, eyes and ears is invaluable toward producing a quality mount. Damage to hide is costly to repair. Some types of damage simply can not be "fixed" by the taxidermist.

Many trophies are ruined in the first few hours after death. As soon as the animal dies, bacteria begins to attack the carcass. Warm, humid weather accelerates bacteria growth. In remote areas, or areas not near our taxidermist, a competent person may be required to cape out the hide in order to preserve it.

Every taxidermist has a preferred method of caping a hide. Contact your taxidermist prior to your hunt in order to get instructions on their caping requirements. However, the following techniques are generally acceptable.

Skinning Life-Size Big Game

There are two major methods of skinning for a large life-size mount. The methods are the flat incision and the dorsal method.

The Flat Incision

The flat incision is used for rug mounts and for a variety of poses. The areas to be cut are shown in Figure 1. Make these slits (cutting the feet free from the carcass) and pull the skin off the carcass. The head is detached as with the shoulder mount.

Flat Incision Illustration

Note: If you cant take your hide immediately to a taxidermist, freeze it to your taxidermist's specifications.

The Dorsal Method

The dorsal method of skinning involves a long slit down the back (from the tail base up into the neck). The carcass is skinned as it is pulled through this incision. The feet/hooves and the head are cut off from the carcass as with a shoulder mount explained later. Only use this method with approval and detailed instruction from your taxidermist. Use this method only when the skin can be frozen quickly after skinning.

Caping for a Shoulder Mount

1. With a sharp knife slit the hide circling the body behind the shoulder at approximately the mid-way point of the rib cage behind the front legs. Slit the skin around the legs just above the knees. An additional slit will be needed form the back of the leg and joining the body cut behind the legs.
2. Peel the skin forward up to the ears and jaw exposing the head/neck junction. Cut into the neck approximately three inches down from this junction. Circle the neck cutting down the spinal column. After this cut is complete, grasp the horn bases and twist the head off the neck. This should allow the hide to be rolled up and put in a freezer until transported to the taxidermist. The cuts should allow ample hide for the taxidermist to work with in mounting. Remember, the taxidermist can cut off excess hide but he can't add what he doesn't have.

Note: When field dressing a trophy to be mounted, don't cut into the brisket (chest) or neck area. If blood gets onto the hide to be mounted, wash it off with water as soon as possible. Also, avoid dragging the antelope out of the woods with a rope. Place it on a sled, rickshaw or a 4-wheeler. The rope, rocks or a broken branch from a dead fall can easily damage the fur or puncture the hide. If you need to drag it out with a rope, attach the rope to the base of the horns and drag your trophy carefully.
